The following is an examiner's statement of reasons for allowance: In the parent application, allowable subject matter was indicated in the 6/15/01 final rejection. For convenience, the reason will be reiterated here and expanded upon to encompass all of the pending claims. The instant invention is drawn to a microtiter system comprising a plate and an acting member support with on or more sample handling or reading members which are adapted to operate on individual wells in the micro plate when disposed upon a plate support surface. A control unit controls the position of the acting member support with respect to defined coordinates on the plate support surface. While many automated samples dispensing machines for use with microtiter plates exist, not of the prior art teaches the acting member which comprises a locator structure depending therefrom for engaging the interior wall surface of one or more wells of the micro-titer plate when introduced therein, to fix the position of one or more unengaged wells in alignment with one or more sample-handling or reading members. The closest prior art is Gordon et al. (USP 5,540,889) who teaches a microtiter plate with exterior wall surfaced, a plate handling machine having a plate support surface(50) and sample handling device(12) which operates on individual wells, a controller(18) for controlling the position of the acting member support(10) and a locator structure(52) disposed on the acting member support for engaging interior wall surfaces of one or more wells(56) of the plate support surface(50) not the well of the microtiter plate itself; see figures 1,2 and 9A-B.
